New SeaSonde® Receive Antenna

Never resting on their laurels, CODAR engineering team members continually strive for improved system durability. Starting late this year the SeaSonde receive antenna will be replaced with an even more rugged version.

The new dome-shaped antenna design features a smooth upper profile absent of any screws reducing likelihood of any water intrusion.

Another advancement is the absence of external horizontal whip ground plane elements, with ground plane to be set inside the mast for protection.

This new design is completely backwards compatible with existing SeaSonde electronics, and will be included with all new SeaSonde remote unit or antenna replacement orders beginning late 2008.

Special Offer: Do you have an older receive antenna in your closet? For a limited time promotional trade-in discounts on older model receive antennae will be available!

Consult company for additional technical and pricing details.
